Executive Summary

A growing body of research indicates that what happens in families—not just in schools—shapes children’s educational performance. *Stronger Families, Better Schools* builds on such research to explore how student performance is linked to family structure, child poverty, and parental education at the school district level in Arizona. This report finds that the share of married-parent families in a school district is one of the strongest predictors of high school graduation rates in the Grand Canyon State. Indeed, the share of families headed by married couples is a more powerful predictor of high school graduation rates there than are child poverty rates, race, and ethnicity. *Stronger Families, Better Schools* also reveals that family structure is the best predictor of gender parity in high school graduation rates in Arizona school districts, according to our models. In other words, boys are significantly more likely to graduate at levels that parallel girls’ rates in Arizona districts with more married families. In sum, Arizona school districts that are home to strong and stable families also tend to enjoy more successful and gender-equitable schools. Accordingly, to improve children’s educational performance across the Grand Canyon State, policymakers, educators, and civic leaders should work to strengthen families as well as schools.

Introduction

Arizona has not been a national leader in high school graduation rates in recent years. While the high school graduation rate has been rising in most states, in Arizona it has been static at a level below the national average. Graduation rates changed hardly at all in Arizona between the 2009-2010 and 2013-2014 school years, going from 75.4 percent in 2010 to 75.8 percent in 2014. This puts the state's graduation rate below the 2013-2014 national average of 82 percent.

There is also a substantial gender gap in graduation rates in Arizona. As in other states, male students there are less likely to finish high school on time than are their female peers. In 2014, the graduation rate for girls was almost 80 percent, whereas for boys, it was less than 72 percent. And this gender gap has not changed much in recent years. In 2010, the same 80 percent of Arizona females graduated on time, compared to 71 percent of Arizona males. The gender gap in Arizona is close to the national average of seven percentage points.¹

However, overall trends in high school graduation rates and the graduation gender gap are not necessarily indictments of Arizona schools. A recent Urban Institute report, for instance, finds that the state's rate of educational improvement from 2003 to 2013 is above the national average.² Arizona's 2014 high school graduation rate is also comparable to or better than those of its Southwestern neighbors Colorado (77 percent), Nevada (70 percent), and New Mexico (69 percent). It is possible, then, that the Grand Canyon State's educational outcomes are driven not just by what is happening in schools, but also by what goes on outside of the classroom in children's homes and communities.

This report explores the role of family structure in public school districts across Arizona as it relates to high school graduation rates and gender equity in graduation rates. By looking at patterns in high school graduation rates, family structure, and a range of socio-demographic factors—including parental education and poverty—in different districts, we hope to discover how the condition of Arizona families may be linked to children's educational performance.

There is substantial variation in educational outcomes in school districts across Arizona, which allows us to explore the relative contributions of family structure, parental education, poverty, race, and ethnicity to local high school graduation rates. On-time graduation rates, for example, vary substantially across Arizona's nearly 100 Local Education Agencies (LEAs), or school districts, that include high schools. So does the graduation gap between female and male students. In 2014, when we ranked school districts by their graduation rates, the top fifth of districts boasted graduation rates around 90 percent or better. The bottom fifth had on-time graduation rates below 70 percent. When we ranked school districts by the ratio of male to female graduates, the top tenth had male graduation rates that equaled or exceeded female rates. In the bottom tenth, however, only 80 (or even fewer) males received diplomas for every

100 females who earned them. Graduation rates and male/female graduation ratios for the 99 Arizona school districts in our study are shown in Table A1 in the Appendix.

What distinguishes school districts with high overall graduation rates and equal numbers of male and female graduates from those with low overall graduation rates and a preponderance of female graduates? In *Stronger Families, Better Schools*, we explore the possibility that parental education, poverty, and especially family structure are related to high school graduation patterns in Arizona. We do so because a long line of studies, starting with the 1966 Coleman Report, have revealed that educational outcomes have a great deal to do with the characteristics of students' families.³ We know that better-educated parents are more likely to read to their children, to spend a lot of time with them, and to participate in youth-related organizations, including PTOs. Poor families have less money to devote to their sons' and daughters' education and face more stresses, which can affect children's schooling.⁴ And two-parent families are typically able to devote more time, attention, financial support, and consistent discipline to their children, all of which redound to the educational benefit of their children.⁵

Finally, recent research from MIT economist David Autor and his colleagues suggests that married-parent families may especially boost the educational performance of boys. The work of Autor's team demonstrates that the gender gap in high school graduation, school suspensions, and school absences is smaller in families with married parents than in unmarried families.⁶ As Autor said to *The New York Times*, "Boys particularly seem to benefit more from being in a married household or committed household—with the time, attention and income that brings."⁷ Another new study finds that this dynamic extends into college: "Males were disproportionately less likely than females to attend college if they came from a family in which the father had been absent from birth."⁸

In this report, we explore the relationships at the district level between family structure, parental education, and child poverty and two important outcomes in Arizona: the share of children who graduate high school and the gender ratio for high school graduation. Our work controls for race and ethnicity in the nearly 100 Local Education Agencies that make up Arizona's school system. We find that public school districts with better-educated parents and more married families enjoy higher high school graduation rates and more gender parity in graduation rates.

Diploma Demographics

Our analyses of the 2014 graduation rates of Arizona school districts indicate that they varied according to several demographic characteristics of local families, namely, the proportion of married-couple families, the average educational attainment of adults, the child poverty rate, and the racial and ethnic composition of school-aged children. In the average Arizona school district, 63 percent of families with children enrolled in public schools were married-couple families, and 27 percent of adults over 25 had graduated from college. In the average district, 20.6 percent of children in public schools lived below the official poverty line, and 51 percent of students were from disadvantaged minority groups (41.5 percent Hispanic, 4.7 percent American Indian, 4.5 percent African-American).”

These averages mask a great deal of variation. The proportion of married-couple families in a district ranged from 88 percent to 25 percent. The proportion of adults with college degrees ranged from 66 percent down to 4 percent, and child poverty rates ranged from 52.4 percent to 0 percent of the children in public schools. The proportion of students who are disadvantaged minorities ranged all the way from 100 percent to zero. Demographic profiles of the 99 Arizona school districts in our study may be found in Appendix Table A2.

Married-couple families. High school graduation rates were higher in Arizona districts with more children growing up in married-couple families. Of the ten districts with the highest graduation rates, all were above average with respect to their proportion of married-couple families. Five were in the top tenth of the distribution of married-couple families, four were in the top quarter, and one was in the top half of the distribution. (See Table 1A.) Of the ten districts with the lowest graduation rates, eight fell below average in their proportion of married-couple families. One was in the bottom tenth of the distribution, while two were in the bottom quarter. (See Table 1B.) The value of the cross-district correlation coefficient between high school graduation rates and proportion of married-couple families was $r = .54^*$.

Adult education level. High school graduation rates were higher in Arizona districts with more adults who had completed or at least attended college. Of the ten districts with the highest graduation rates, eight were above the mean with respect to adult educational attainment, as shown in Table 1A. Five were in the top tenth of the distribution of adult education level, while three more were in the top half. Of the ten districts with the lowest graduation rates, all were below the mean in average educational attainment. As shown in Table 1B, three were in the bottom tenth of the distribution, five in the bottom quarter, and two in the bottom half. The value of the cross-district correlation coefficient between high school graduation rates and average adult educational attainment was $r = .55^*$.

TABLE 1A. Demographic characteristics of Arizona Local Education Agencies with ten highest four-year high school graduation rates in 2013-2014 school year. (Percentile range in which district placed on each, 2009-2013.) Source: Arizona Department of Education for graduation rates; U.S. Census Bureau American Community Survey and National Center for Education Statistics for school district demographic characteristics. Ranking of Local Education Agencies by graduation rate excludes districts on American Indian reservations and those with fewer than 35 students in 2013-2014 senior class.

Child poverty. High school graduation rates were also higher in Arizona districts with lower rates of child poverty. Of the ten school districts with the highest average graduation rates, nine were below average with respect to their proportion of households with children enrolled in public school that were below the official poverty level. As shown in Table 1A, five were in the bottom tenth of the distribution of child poverty households. Two were in the bottom quarter and two were in the bottom half of the distribution. Of the ten districts with the *lowest* graduation rates in the state, eight were above average on the child poverty distribution. One was in the top tenth of the distribution, as Table 1B illustrates. One was in the top quarter and six were in the top half of the distribution. The value of the cross-district correlation coefficient between high school graduation rates and child poverty rates was $r = -.50^*$.

Student race and ethnicity. Graduation rates were lower in districts with larger proportions of children who are American Indian, Hispanic, or African-American. Of the ten districts with the highest average graduation rates, nine had lower-than-average numbers of disadvantaged minority students. Only one was above average with respect to minority enrollment. Of the *bottom* ten districts for graduation rates, all but two had high proportions of minority students, as shown in Table 1B. Note that districts in Native American reservations were excluded from the Top and Bottom Ten rankings, but not from the regression analysis. The value of the cross-district correlation coefficient between high school graduation rates and proportion of disadvantaged minority students was $r = -.50^*$.

TABLE 1B. Demographic characteristics of Arizona Local Education Agencies with ten lowest four-year high school graduation rates in 2013-2014 school year. (Percentile range in which district placed on each, 2009-2013.) Source: Arizona Department of Education for graduation rates; U.S. Census Bureau American Community Survey and National Center for Education Statistics for school district demographic characteristics. Ranking of Local Education Agencies by graduation rate excludes districts in American Indian reservations and those with fewer than 35 students in 2013-2014 senior class.

Size of child population. Arizona school districts vary widely in the number of children enrolled in their public school systems. During the 2009-2013 period, the ten largest districts had average enrollments that ranged from 75,000 for the Mesa Unified District to 27,000 for the Scottsdale Unified District. During the same time period, the ten smallest districts had enrollments between 545 for the Gila Bend Unified District and 115 for the Patagonia Union High School District. The median district enrolled 2,530 students, while the mean district enrollment was considerably higher at 8,317.

We excluded students attending charter schools from our study because of the difficulty of establishing the demographic characteristics of the areas from which these students were drawn. The total number of Arizona high school seniors included in our study is 66,240. They represent 84 percent of the statewide senior cohort for the 2013-2014 academic year (79,189).

There was some tendency for larger districts to have higher graduation rates than smaller ones. But the relationship between enrollment size and graduation rates, while weakly positive, was not statistically significant ($r = .12$ ns).

Higher Graduation Rates in Districts with more Married-Parent Families

When we combined five demographic characteristics of Arizona school districts in a multivariate regression analysis, the ones that emerged as most predictive of graduation rates were the district's proportion of married-couple families and the average educational attainment of local adults. The regression model accounted for 41 percent of the variance in graduation rates across districts. The value of the multiple correlation coefficient relating the combined demographic factors to graduation rates was $R = .64^*$. This was significantly larger than the largest bivariate coefficients for the individual demographic characteristics. Table 2 summarizes the bivariate correlation coefficients for each of the demographic factors on its own, as well as the standardized correlation coefficient for each factor in the multivariate analysis.

DEMOGRAPHIC CHARACTERISTICS OF LEAS	BIVARIATE RELATIONSHIP r	RELATIONSHIP ADJUSTED FOR OTHER FACTORS (beta)
% Married-Couple Families	.54**	.35**
Avg. Adult Education Level	.55**	.37**
Child Poverty %	-.50**	-.02ns
% Disadvantaged Minority	-.50**	-.02ns
Enrollment Size	.12ns	-.02ns
% VARIANCE MODEL ACCOUNTS FOR		R Squared = .41** R = .64**

TABLE 2. Relationship of demographic characteristics of Arizona Local Education Agencies (LEA) to their four-year high school graduation rate; LEA demographic characteristics as of 2009-2013; graduation rates, 2013-2014. Source: Authors' analysis of data from Arizona Department of Education for graduation rates; U.S. Census Bureau American Community Survey and National Center for Education Statistics for school district demographic characteristics. * $p < .05$, ** $p < .01$

The positive relationship between the proportion of married-couple families in a school district and the district's graduation rate was weaker in the multivariate model (beta = .35*) than as an uncontrolled bivariate relationship ($r = .54^*$). In other words, the relationship between family structure and graduation rates in districts is partly attributable to local levels of adult education and child poverty, as well as racial and ethnic composition. But even after accounting for these factors, a significant link between more married-couple families and higher graduation rates remained. In fact, family structure was the second strongest predictor of district graduation rates in 2014, after adult educational attainment, and was stronger than child poverty, race, ethnicity, and enrollment size. As shown in Figure 1, before adjustment, there was a 4.6 percentage-point increase in graduation rates for every ten percentage-point increase in married-couple families in a district. After adjusting for education and race/ethnicity, there was a 3 percentage-point increase in graduation rates for every ten percentage-point rise in married-couple families.

The negative relationship between the proportion of disadvantaged minority children in a school district and the graduation rate of the district was weaker and not statistically significant in the multivariate model (beta = -.02ns), whereas it was significant as an uncontrolled bivariate relationship (r = -.50*). This is probably because districts with higher minority populations, including Native American reservations, tend to have lower adult education levels, higher child poverty rates, and fewer married-couple families.

It is notable that the proportion of public school children living below the official poverty level, which exhibited a strong negative relationship to districts' graduation rate on a bivariate basis, became insignificant in the multivariate model. This is likely due to the fact that child poverty was itself strongly related to adult education level (r = -.68*) and the proportion of married-couple families in a district (r = -.62*). When these two characteristics, along with race and ethnicity, were combined in a multiple regression analysis, they accounted for 59 percent of the cross-district variance in child poverty (R = .77*). The multiple regression results indicate that child poverty accounts for no further variance in district graduation rates beyond what is accounted for by the average educational attainment of local adults, family structure, and the racial/ethnic composition of the child population.

FIGURE 1

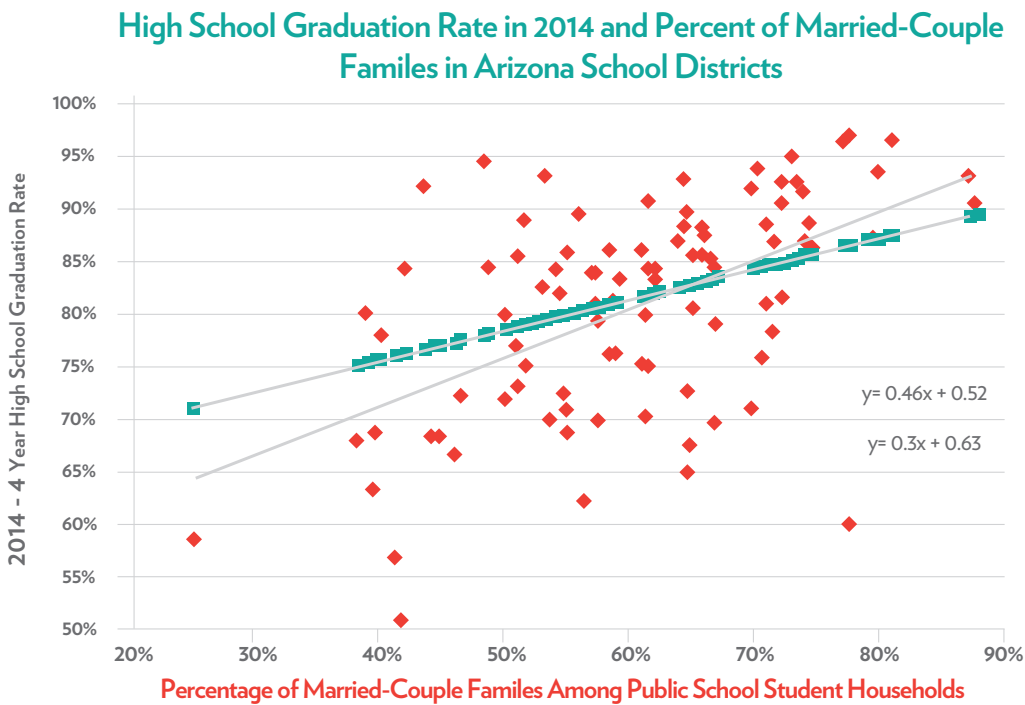

FIGURE 1. Relationship between high school graduation rate and proportion of married-couple families in Arizona school districts in 2014. Trend lines and equations show best-fit linear relationships between family structure and graduation rates as observed and after adjustment for district education and income levels and racial and ethnic composition of district student population.

Source: Authors' analysis of data from Arizona Department of Education and U.S. Census Bureau's American Community Survey for 2009-2013.

Smaller Gender Gap in Districts with More Married Parents

Variation from one Arizona school district to another in the ratio of male to female high school graduates is likewise related to demographic characteristics of families with children enrolled in public schools in the district. In particular, the male/female graduation ratio was generally higher in districts with larger proportions of married-couple families. The ratio tended to be lower in districts with higher proportions of students from disadvantaged minority groups, particularly those with high proportions of American Indian or Hispanic students.

Married-couple families. High school graduation rates for male and female students were more similar in Arizona districts with more children growing up in married-couple families. Of the ten districts with the highest male/female graduation ratios, seven were above average with respect to their proportion of married-couple families. Four were in the top tenth of the distribution of married-couple families, two were in the top quarter, and one was in the top half. (See Table 3A.) Of the ten districts with the lowest male/female ratios, eight were below average in their proportion of married-couple families. As Table 3B shows, one was in the bottom tenth of the distribution, while three were in the bottom quarter and four were in the bottom half of the distribution. The value of the cross-district correlation coefficient between high school graduation rates and proportion of married-couple families was $r = .29^*$.

TABLE 3A. Demographic characteristics of Arizona Local Education Agencies with ten highest male/female high school graduation ratios in 2013-2014 school year. Percentile range in which district placed on each, 2009-2013. Source: Arizona Department of Education for graduation rates; U.S. Census Bureau American Community Survey and National Center for Education Statistics for school district demographic characteristics. Ranking of Local Education Agencies by male/female graduation ratio excludes districts in American Indian reservations and those with fewer than 35 students in 2013-2014 senior class.

Student race and ethnicity. Male and female graduation rates were more disparate in districts with larger proportions of American Indian or Hispanic children. Of the top ten districts in terms of male/female graduation ratios, seven were below average with respect to their numbers of disadvantaged minority students. Five of these six were in the bottom tenth of the minority student distribution, as depicted in Table 3A. Of the ten districts with the lowest male/female graduation ratios, all but two had high proportions of minority students. As shown in Table 3B, four of these districts were in the top quarter of the distribution of disadvantaged minority students and four were in the top half. The value of the cross-district correlation coefficient between the male/female graduation ratio and the proportion of disadvantaged minority students was $r = -.28^*$. When the correlation was examined separately for American Indian, Hispanic, and African-American students, however, it was only for American Indian students that the correlation approached statistical significance ($r = -.19^+$).

We did not find adult educational attainment, child poverty, or enrollment size in a district to have a statistically significant relationship with the male/female graduation ratio. The correlation coefficients for these relationships were .14ns, -.10ns, and .06ns, respectively.

Conclusion

In Arizona, public school districts with better-educated and more married parents boast higher high school graduation rates. Gender equity is also greater in districts with more married parents. That is, boys come closer to matching the high school graduation rates of girls in districts with more married-parent families. Moreover, married parenthood is a better predictor of these two high school graduation outcomes than are child poverty, race, and ethnicity in public school districts across the Grand Canyon state.

Our results suggest that one reason that Arizona has not achieved above-average outcomes in the educational arena, and high school graduation in particular, is that it is home to a student population less likely to live in stable families than American children as a whole. The state ranks 33rd in the United States when it comes to the share of its children living with married parents (67 percent).⁹ If the state enjoyed more stable families, it might also see better educational outcomes among its children. It's for that reason that Arizona should consider measures designed to strengthen and stabilize families. The following two proposals are worth considering:

- 1) Arizona should increase efforts to improve vocational education and apprenticeship programs. By raising the skills, earnings, maturity, and self-confidence of young men and women who are not on the college track, such programs would help more young people forge strong and stable marriages. Research shows that work-based learning programs in high schools, like Career Academies, have promising effects on the earnings and marriageability of young men from disadvantaged backgrounds.¹⁰
- 2) Private and public initiatives to provide social marketing on behalf of marriage could prove helpful. Campaigns against smoking and teenage pregnancy have taught us that sustained efforts to change behavior can work. We would like to see a civic campaign organized around what Brookings Institution scholars Ron Haskins and Isabel Sawhill have called the “success sequence,” where young adults are encouraged to pursue education, work, marriage, and parenthood in that order. A campaign organized around this sequence—and receiving statewide support from educational, media, pop cultural, business, and civic institutions—might meet with the same success as has the nation's recent campaign to prevent teen pregnancy, a campaign which has helped drive down the teen pregnancy rate by more than 50 percent since the 1990s.¹¹ Needless to say, the success sequence should also be incorporated into family life education in public schools.

These are just two ideas. More should be explored. The bottom line: policymakers, educators, business leaders, and religious leaders in Arizona need to address the fragile foundations of family life if they hope for the state's children to lead the nation in academic achievement.

Note: List of Arizona LEAs excludes those that cover elementary schools only and those too small for reliable demographic estimates from Census Bureau's 2009-2013 American Community Survey.

MARCPFAM = Percent of households with public-school enrolled children in district that are married-couple families.

ADLTEDUC= Average educational attainment of adults 25 and older in district. 1 = Less than high school. 2 = High school graduate. 3 = Some college. 4 = College graduate. 5 = Postgraduate or professional degree.

CHILD POVERTY = Percentage of public school children aged 5-17 whose family income was below the poverty level, 2009-2013.

%HISPANC = Percentage of children enrolled in public school in district who are Hispanic.

%AMERIND = Percentage of children enrolled in public school in district who are American Indian.

%AFRAMER = Percentage of children enrolled in public school in district who are African-American.

ENRMLMNT = Number of 5-17 year old children in district who are enrolled in public school.

MEANS are weighted by district enrollment, except for racial-ethnic percentages, which are weighted by size of senior class cohort in district. Enrollment mean is unweighted.

Source: Authors' calculations from tables prepared by U.S. Bureau of the Census and National Center for Education Statistics based on American Community Survey 2009-2013.

ABOUT THE AUTHORS

W. Bradford Wilcox is director of the National Marriage Project at the University of Virginia and a senior fellow of the Institute for Family Studies. His research focuses on marriage, family structure, child well-being, fatherhood, and religion. A sociologist, he is the author and co-author of four books and numerous articles, including *Gender and Parenthood: Biological and Social Scientific Perspectives*. He has held fellowships at the Brookings Institution and Yale University. He received his doctorate from Princeton University.

Nicholas Zill is a research psychologist who directed the National Survey of Children, a longitudinal study that produced widely cited findings on children's life experiences and adjustment following parental divorce. He was the first project director for the Head Start Family and Child Experiences Survey and contributed to the Head Start National Impact Study. He founded the organization Child Trends. He is the co-author of *Running In Place: How American Families Are Faring In A Changing Economy and An Individualistic Society* and *Who Reads Literature? The Future of the United States As A Nation of Readers*. He has served on a Florida state expert advisory committee on early childhood education. He received his doctorate from The Johns Hopkins University.
